

## Foreword from Id

The greatest warrior that has ever walked the face of the Earth goes back in time, one last time, to make sure that the time line will continue only to face his greatest challenge: love. Will he for sake love to preserve Humanity? Will the time line continue?

## Foreword from the Great One

Today I am the greatest warrior that has ever walked the face of the Earth. I fought 538 of the greatest warriors in 12 minutes, with only me still standing, alive.

Time is the only thing that matters. The only thing that really matters. It is the only thing worth fighting for, dying for and losing the one true love your life for. Time is that powerful.

I would gladly give my life to defend Time. I would gladly die to protect Time, but will I give up the love of my life for Time? Is Time worth a damn if the one girl that I love with all of my heart and soul is not there to share it with? I don't know. I just don't know any more. I thought that I did before, but not any more.

## Prologue

December 21, 2012. This is the last day on the Mayan calendar. For some reason, the Mayans had been calculating dates back to over 300 million years ago. But on December 21, 2012 their calendar ended.

The Mayans believe that this date was the end of time. Their solar year was 365.2420 days. This is just .0002 days off from being perfect. This calendar was extremely more accurate than the Gregorian calendar of 1582. The Gregorian calendar is the one that we use today.

So why did the Mayan calendar end on this day? Did they know something that we don't know? Why did they predict the end of time? How did they predict the last day of the Earth, so long after the Mayan civilization had vanished?

## Prologue II

The brain is the most powerful organ of the human body. It's not the biggest, that would be the skin, it's not the strongest muscle, that is the heart. The brain has so much power that no one that is alive today knows its complete power.

Some believe that humans only use ten percent of this powerful organ. They are wrong. This piece of miss information came from a book in the 1950's that compared an average brain to Einstein's. The book's author said that compared to Einstein we on the average only use five percent of our brains.

We have and will always use one hundred percent of our brain. The human brain loves to learn. That is how our species has survived until the modern day. Without the full use of the brain, the Homo sapien would have gone extinct.

The way the human brain works can be summed up with one word : patterns. Every time that we learn, see, hear, touch, smell, taste, feel, sense or any other input information that we send our brains, a little wiggle is made. The more times that we do something, the stronger the wiggles become.

As the years go by, more is learned about the brain. One day perhaps we will obtain the knowledge that mankind has been searching for, a chance for another life....in time.

## Chapter 1 Back in the future

A blue eerie electric field covered Dr. Michael Harris. His colleagues looked on him with a sense of pride and excitement. This was the first time a human would travel in back in time. Dr. Harris had been working on this project for the past forty-three years. He had missed seeing his only daughter grow up. His wife, Lynn almost left him a few times, but since she was a scientist also, she devoted her life to science as well. Little Sera had grown up, and followed her in her parents' footsteps and earned a Ph.D. in time theory as well.

Both his wife Dr. Lynn McGee-Harris and his daughter Dr. Sera Harris were there to witness the big event. The first man to travel back in time, Dr. Michael Harris who gave his entire professional life to fulfill his dream to control time. It cost the

government and the university a small fortune to fund his time experiments, but look at what they would get in return.

Dr. Michael Harris had been patient in his experiments. Last year he had sent a dog back five minutes in the past. What returned had been a dog that looked like it had been possessed by some evil force. The first dog that traveled back in time had to be destroyed. Sparky had attacked three of the lab workers before the security officer had killed him with his sidearm.

But Dr. Michael Harris figured out what went wrong, and had corrected it. Every thing was going to be all right now. His dream was about to come true. He would travel back in time one hour. The lab one hour ago had a book that he was going to bring back with him. This book was removed exactly 55 minutes ago from the lab and placed in a lock safe. He was going to read that book until he caught up with the current time. In exactly in one hour, that book would move from the safe and appear in Dr. Harris's hands along with Dr. Harris himself.

The blue light got stronger, he looked at his daughter that he barely knew then his wife that he was once in love with. He was married to his research, but the second before he disappeared, he mouthed to them, "I love you". Then he was gone.

Dr. Michael Harris was in a time tunnel. The trip seemed to take forever but it also seemed to take a nano second. A few moments later, he was on the floor next to the time device. He stood up and took the book from the table. He did it.

"I can't believe that I am back in time! I can't wait for the rest of the scientists to see that time travel is possible. I hope that Lynn and Sera will finally see that it was all worth it," said Dr. Harris.

Dr. Harris took the book and sat down to read as he waited to catch up in time. All of the sudden he got a terrible headache. He reasoned that this must be a side effect. Then he started to have weird thoughts like the world was caving in on him. Everyone was out to get him. He was famous and everyone owed him because he owned the entire planet. He was the King of the world, and everyone would have to start to show him some respect.

The hour was almost up, he started to see the lab of traitors. All of them were jealous of him. He was the greatest scientist in the world and none of them could even understand one tenth as much as he did about time. All of them were ingrates.

"I will show them," he said as the hour went up.

Sera was the first to see her father back from the past. The entire lab stared to cheer and clap.

"I will kill all of you!" screamed Dr. Harris.

He went over to the time device and switched a few cables. He was going to feed back the time device. This would blow up half of the town.

"What are you doing?" asked Dr. Lynn McGee-Harris.

By the time she had asked the question, Dr. Harris had taken down one security officer and grabbed his weapon. He started to shoot pellets everywhere.

"Dad, please stop! We are your family!" screamed Sera.

Dr. Harris had wounded a few lab workers. Four more security officers rush into the lab and took aim at the crazed time traveler. Dr. Lynn McGee-Harris ran up to her husband to try and save him.

"Mike, clam down. We all are your family and friends. We..." a pellet to Dr. Lynn McGee-Harris's head ended the conversation.

"NO!" screamed Sera.

A second later the security officers fired their weapons. Dr. Michael Harris, the first man to travel in time was no longer alive. He was shot in front of his daughter. Sera ran over to her dead parents.

"Why! Why!," she asked as she kneeled next to them.

Ka-boom! A large explosion that shook the entire town rumbled thought the lab. Then there was a bigger explosion a few seconds later. It sounded like another World War had begun. All Sera could do was to hold her dead parents and cry. Was the world coming to an end like it was told in the legend? Where was the Great One? Was there really a Great One, and where was he at now?

"Great One! Where are you!" screamed Sera as her world was falling apart around her.
